

# Fluid Cast

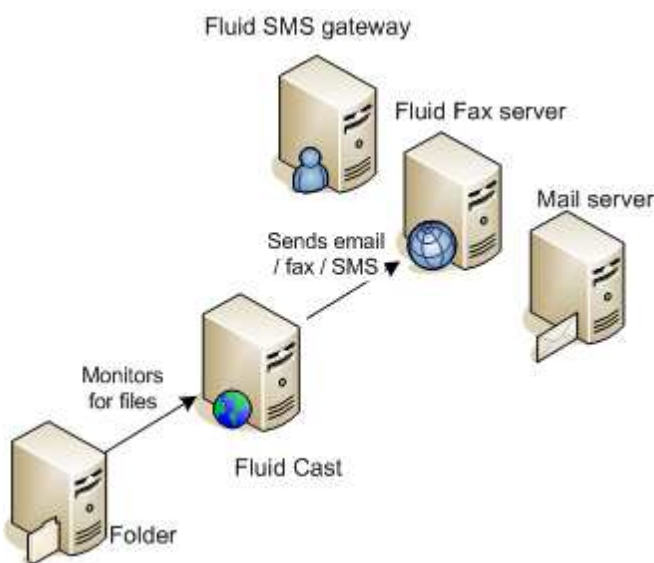

Automatic sending of emails / faxes / SMSes for Windows 7, Vista, XP, 2008, 2003

## Automatic sending of emails / faxes / SMSes from files in a folder

Fluid Cast scans a particular folder for files and automatically sends out emails based on the contents of the files.

External systems such as SAP and Navision can be configured to drop files into a particular folder by batch processing. Fluid Cast can pick up these files and send them automatically.

The emails can be sent to a fax server such as Fluid Fax server or an SMS gateway such as Fluid SMS Gateway and be sent out as batch faxes or SMSes.

## Transformation of email content

For a source file that is a text file separated by a separator, such as a csv (comma separated values) file, Fluid Cast can be configured to retrieve the values of each data column in the file. It can then substitute the various parameters of an email based on these values.

The parameters include email sending time, sender email address, recipient email address, subject, message body and attachment. An email with the substituted parameters will be sent for each line of the text file.

## Web-based interface

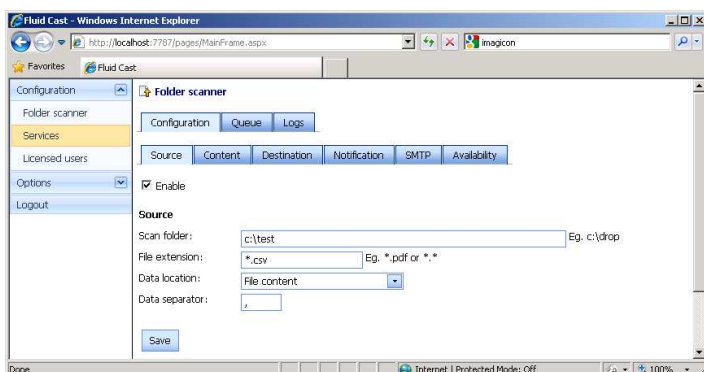

Fluid Cast is web based and can be accessed using a web browser.

## Multilingual and Unicode support

Users can send emails / documents containing Unicode characters. The user interface also supports Chinese characters.

## System Requirements

- Windows 7, Vista, XP or
- Windows 2008, 2003, 2000 server
- 256MB RAM and 800MHz processor

Configuration of the source folder
